

# Bold Metrics Assessment Test

## Introduction

Congratulations on advancing in the application process. It has been great talking to and getting to know you in our earlier conversation. To continue the application process, we have prepared a technical assessment. This assessment is designed to help us to get an idea into your approach to data and how you work through tasks.

You will receive the actual task and data in the call which we have planned, but we just want to give you a heads up on what is roughly to be expected so that you can prepare anything if you find that this would help you.

### Technical Assessment Call (TAC)

The TAC mimics one aspect of your potential role here at Bold Metrics. We have various clients for which we receive datasets that are to be ingested into the DWH periodically and we'll go through one of these during the interview.

In the TAC you will receive a dataset in CSV format, for which you will be asked to manipulate and query the data to get to answer a set of questions using Python and SQL. The goal of this test is to provide you with an opportunity to show us your proficiency in both languages, and for us to assess your approach to the data and the task.

The test includes **X** questions/tasks for which you will have to use SQL and **X** questions/tasks for which you'll have to use Python.

We are looking forward to going through the TAC with you, and feel free to use the above information to prepare anything that you deem necessary that will allow you to best demonstrate your skills.
